

M-05

Tactical Mechanical Tourniquet

DESIGNED BY THE US MILITARY

Extremity hemorrhage is a major cause of preventable death globally and the number-one cause of preventable death on the battlefield. 1 Death from blood loss can occur in as little as five minutes from a severe extremity injury. Tourniquets are a proven device to stop severe, life-threatening bleeding. Developed by the US military and recommended by the Committee on Tactical Combat Casualty Care (CoTCCC), the TMT^{IM} is used by militaries, medical professionals, and public safety agencies worldwide.

NO INTERNAL BAND: Eases slack removal and allows for rapid resetting.

2" WIDE: Achieves occlusion at lower pressures.

UV-PROTECTIVE ADDITIVE TO POLYMERS: Durable enough to be stored outside or packaging.

TWO LOCKING MECHANISMS:

Double-routed speed buckle and hook and loop backed strap prevents slippage and pressure loss.

QUICK-DISCONNECT BUCKLE:

Prevents misrouting of tail and allows for trapped-limb application.

ENHANCED TORSION BAR

SECURING: Audible signature "click" identifies the torsion bar is secure.

MULTIFUNCTION: Undeniable advantage when combined with the TQ-RAM[†] for point pressure over wound packing and additionally provides proximal hemorrhage control.
